The Technology That Actually Programs Your Brain

Decades ago, it was discovered that certain brainwave frequencies associated with desirable states of mind - such as creativity, relaxation and resourcefulness - can actually be induced, or recreated, with the right kind of audios. However, it wasn't until recent years that the internet made it possible to share this technology easily with the millions of people across the globe.

What this means is that by using a [high quality brainwave entrainment program](#), you will be able to get into exactly the right mental state by listening to special tracks which have been prepared with binaural beats embedded into them.

For binaural beats to work, you must listen to the audio tracks with headphones.

The ease of use of this new technology is simply astounding. To achieve these results using more traditional methods, like meditation, would take you years of practice.

Now you can skyrocket your productivity and boost your creativity much faster than was previously possible. This guide will teach you everything you need to know about how to harness the power of binaural beats in your life.

What Are Binaural Beats?

When you were a kid were you fascinated by those dog whistles that you could blow, not hear but all the dogs in the vicinity would come running? The high pitch was something that only they could hear, and though it seemed the dogs didn't seem to arrive in droves as they did in the movies, it was enough for perhaps your pet dog to prick up his ears before sliding back into sleep.

Imagine being about to use auditory sounds that talked to different parts of your brain directly, instead of needing to be filtered through your thoughts and conscious mind. It's a little like that dog whistle - you might not be able to understand or "hear" what those sounds mean, but those parts of your brain it's designed for sure can.

Our brains are fascinating things. Scientists still struggle to try and determine the very length and breadth of our brain's capabilities. Study shows we use only a small proportion of our brains, but the potential in unleashing some of the parts we do not use is astronomic.

The problem is how to access these areas. Certainly regular meditative practices, a holistic lifestyle incorporating eastern practices such as yoga, and a healthy diet that doesn't include plenty of mind numbing chemicals definitely helps.

However for many of us, that type of lifestyle is one we either try to follow but fall short, or don't even really bother before. Reality normally includes way too much time spent in traffic, the stress of overdue work and the chores that never seem to end. For most of us we need a short cut, a simple method of getting our brain trained to think and act to its fullest capacity .

That's where binaural beats come in. These sounds stimulate your brain without you needing to think, move or do anything. While you listen, these beats safely, quickly, and effectively stimulate your brain and lead you to specific states of consciousness.

Binaural Beats Entrain the Brain

When the two different sounds are heard the brain tries to find the middle ground between them. For instance if you play a sound at 100hz in one ear, and play a sound at 108hz in the other, the brain will produce the difference: 4hz.

This is what is known as frequency-followed response. The brainwaves want to follow the sound and match it. This process is called entrainment.

While it's common to use sounds to get this effect, there are other options. Some people can use visual stimulation, and some use both the visual and aural stimulation together to produce the effect.

There is a need to be cautious of using visual stimulus however as it can trigger epilepsy and cause seizures in those prone to them.

Who found out about them?

Ideas such as binaural beats being used to help meditation and relaxation may sound a little out there. So where did the idea come from? Was it some strange thought conceived to sell a pile of new age ideas?

Hundred of years ago it was discovered that if you played one note in one ear, and another in the other, a new note or tone appeared to be heard inside your head. However it wasn't until 1839 that the concept was proven to be true after it was scientifically tested and documented.

Prussian physicist and meteorologist Heinrich Wilhelm Dove discovered the effect of binaural beats on the brain in 1839. Dove had a very broad career which included over three hundred papers on experimental physics. He discovered this effect early on in his career and then spent long periods of time exploring it in more depth, discovering the ways in which it affects the brain.

Recommended Resources:

This digital book is distributed by [Chris Cade](#)

Binaural Beats Entrain the Brain

He discovered that playing slightly different beats into each ear produces a perception of beats that are not actually there. This is the essence of Binaural Beats. It feels a little like a wah wah sound inside your head, similar to the feeling of all the car windows down as you are heading down the highway, or an opera singers vibrato. If you've ever listened to the sound of a baby's heart inutereo, that wah wah sound will sound a little similar. Basically if two slightly different frequencies are playing into either ear the brain tries to find the common ground which gives this wah wah effect.

He also made important discoveries about a raft of other areas, including observing cyclones travel the earth clockwise in the southern hemisphere but anticlockwise in the northern hemisphere. He had a lot of influence over the development of meteorological science, looking at the effect of our climate on the growth of plants, and how heat is distributed over the surface of the earth.

Dove was also the first person to measure the strength of an electrical current in a wire which he found by using a magnetic field. He was a well esteemed scientist and researcher, whose work was respected and valued.

Dove did little more than prove the phenomena occurred. It wasn't until one hundred and thirty four years after his paper was published that scientists and researcher Gerald Ostler published an article in Scientific American magazine that provided fresh findings, backed up with laboratory research, which shows how these binaural beats could affect the brain, depending on the frequency.

Ostler recognized that these binaural beats were a tool cognitive and neurological researchers could utilize to learn how animals were able to use sounds to locate their prey in an environment where sounds can ricochet on trees or rocks before they get to their ears.

Recommended Resources:

[Nitrofocus®](#), [Brain Salon](#), and [Trinity Trance Technology™](#)

This digital book is distributed by [Chris Cade](#)

Binaural Beats Entrain the Brain

He was also interested in how animals can be surrounded by sound everywhere but can focus on one particular sound and zero in on it.

It's something mothers have done for centuries. Put a pile of babies in a room and mothers will happily chat and talk without needing to watch, but the moment one baby cries that mother can identify that cry as being her child, no matter the volume of the others around the baby. This is also known as the “cocktail party” effect as people also adopt it to differentiate sounds in crowded parties.

However the human's ability to differentiate sounds is nothing compared to many in the animal kingdom who are able to listen for both prey and predators, knowing the difference in the sounds they make.

Ostler also felt the binaural beats were a potentially useful tool when trying to diagnose different conditions. As well as the obvious advantage of helping determine and hearing or auditory issues, Ostler felt it may also help to diagnose psychological conditions. That is because binaural beats use different pathways in the brain than is used when hearing normal everyday sounds.

One of the differences Ostler noticed was that people suffering from Parkinson's disease were unable to perceive binaural beats. Treating Parkinsons alleviated the issue with Ostler noticing the changes within a week of treatment in several patients.

Ostler also found there is a gender difference in being about to perceive binaural beats. Women find it easier to perceive them at two points in their menstrual cycle, first at the beginning of menstruation, and then again about fifteen days later (generally around the time of ovulation) From this Ostler theorizes binaural beat perception may be affected by estrogen levels.

Binaural Beats Entrain the Brain

In the 1970's, Robert Monroe founded an institute devoted specifically to using binaural beats for understanding human consciousness. He pioneered programs to support people with a range of psychological struggles, including managing stress, reducing anxiety and helping with concentration. The Monroe Institute has produced the largest body of scientific knowledge specifically about the uses of brainwave entrainment for these purposes.

It's also since been used to reduce sleeping times needed, improving learning of new information and helping to get into a meditative state. Studies have also shown that your brain can reorganize itself by listening to binaural beats, and it can help the left and right hemispheres come back into balance. This can have huge benefits for people who either struggle to come up with creative concepts or conversely apply logic to situations (as these come from differing sides of the brain.)

All of these have been studied and have found to have valid findings that are in favor of using them to enhance our lives.

Binaural Beats Entrain the Brain

How Do Binaural Beats Work?

If you think that you're going to feel a little foolish listening to apparently nothing, you can relax. If you did listen to the beats by themselves it would sound a little like a motorboat with its engine running underwater. Because that is perhaps not the most engaging sound to listen to, many producers have created several different methods of masking that sound a little. Your ears may not be able to hear the brainwave entrainment sounds in the background, and your brain still can.

Binaural beats are added to tracks of music that you can listen to as your brain does its work. The type of music generally changes to match the primary reason you are listening. For instance if you want to listen to become more relaxed, then the music is more relaxed. If it's because you want to sharpen your focus, then the music upon which the binaural beats are laid on top of is generally more upbeat and steady.

The music also gives your conscious mind something to focus on as it relaxes and rests while your subconscious mind takes over.

Not all tracks are set to music. Sometimes they are set to white noise, or to sounds of nature. Occasionally the binaural beats sounds can be heard faintly depending on the producer's decision

As you need to hear the separate sounds going into each ear, it's not enough to simply put the track on your stereo and play it into a room. **You need to have stereo headphones on** so your brain can experience the sensation of having the different tones played in each ear.

Even if your ears can't hear the frequencies, your brain can. These tones talk to your brainwaves and help them either slow down or speed up, depending on what your purpose is.

Binaural Beats Entrain the Brain

Why Should I use Binaural Beats?

Our subconscious minds have a hard time in our busy lives. We have both a conscious and subconscious mind and need to have both in ship shape order for our minds, bodies, and spirits to function optimally.

Our conscious minds are only able to do one thing at a time. It's the part of us that rationalizes and analyses everything. We need our conscious mind to help us to remember things we only need to store for a few moments such as telephone numbers or that you need only need to pick up milk and bread. This part of us is around all the time we are awake-talking to us and helping us function in our everyday activities. It's our problem solver, the part of us that sees everything from a very logical place.

Our subconscious is busy too, but is like the chef in the back of a huge restaurant. You don't see them, but they're making all the great food to nourish you and help you enjoy life. It's in charge of all the mechanics of your body like your heart rate and your breathing. But it's also in charge of releasing the chemicals into your body that produce emotions.

The subconscious mind is also in charge of your memories and your ability to store new information in the right place so you can use it when you need to. Anytime you remember a special smell or memory it's your subconscious helping you find it.

With all the busy-ness of our lives, giving your subconscious time to relax and reboot, find space to put new information, or just not be quite so anxious is increasingly difficult.

Binaural Beats Entrain the Brain

Binaural beats help your subconscious have a chance to get sorted. Because the brainwave entrainment going directly to your brain, it manages to slip past that chatterbox conscious self and talks directly to your subconscious. It gives you something to focus on while your brain does the work automatically.

So much of our day to day life stems from the actions of our subconscious, brainwave entrainment makes it easier to talk to it by opening up the pathways and synchronizing our left and right brains.

Who Should use Binaural Beats?

There are a range of different reasons to use binaural beats. The key is to use the correct one for the suggested outcome. Different frequencies affect different layers of our conscious state.

Treating addictions including smoking and food issues

Anyone who's ever struggled with an addiction and tried to just "give it up" will know it's not quite that easy. Our bodies like to stay the same, lulled into whatever state we have them in now. Any change, even good change is met with a pile of hostility and panic by our conscious state. Our subconscious state can re-jig our thinking to help us let go of the fears, stress and biological changes that come with releasing ourselves from addiction.

Binaural beats, along with regular meditation and learning some mantras that change the way you see your relationship between you and your addiction can help you to conquer the addiction once and for all

For many of us, our addictions flare up or become more pronounced at times of deep stress. The relaxation effect of binaural beats help us to remove that excess stress helping us to manage our behavior and prevent any of that falling off the wagon behavior so common with addictive issues.

Who Should use Binaural Beats?

Improving sleep

Binaural beats help you reach a place where [you can more easily get to sleep](#). It can slow all the noise down and help you to relax. If you struggle to relax enough at bedtime to even get to sleep without a pile of pillow thumping, tossing and turning and the odd expletive, then binaural beats may be a good option. Playing them as you lie with your eyes closed can help you drift into a deep and refreshing sleep.

With the amount of stress many of us are subjected to it's an excellent way to still some of the worries that prevent us from sleeping well.

Pain Reduction

Suffering from chronic pain is incredibly exhausting and draining. It is very easy to slip into a pattern where you focus on the pain, and even start to second guess it. Our brains can actually become so attuned to the pain that the intensity feels more unpleasant and the pain feels worse.

Binaural beats can help you change your focus so you don't need to seek out the pain. It can help you to deregister your pain threshold and reduce the sensation of the pain you are experiencing.

Recommended Resources:

[Nitrofocus®](#), [Brain Salon](#), and [Trinity Trance Technology™](#)

This digital book is distributed by [Chris Cade](#)

Who Should use Binaural Beats?

Reducing Anxiety, Fear, and Worry

Studies have shown binaural beats have shown to be effective in [reducing anxiety](#) over a period of several months if used on a regular basis. If you struggle with panic attacks, binaural beats can help you reduce the symptoms and prevent them from occurring. It's also good for improving general optimism and feelings of coping.

If you have a major event coming up that may also produce anxiety such as a major operation, a huge lifestyle change or a large examination, binaural beats can also reduce anxiety for these specific events.

Improving Mood

If you have low grade depression, then using binaural beats may help you relax and reduce stress which in turn can reduce your depression

If you have a diagnosed condition and are taking treatment, using binaural beats can help you relax as you relearn some more positive thinking behaviors. While it is not advisable to stop medication once prescribed, the use of binaural beats can help you reduce some of the long term effects of your illness.

Others, who may have chronic mental illness have found that alongside long term prescription drug treatment, binaural beats are a useful tool that gives them the opportunity to manage further downturns in mood and avoid hospitalization

Who Should use Binaural Beats?

Enhanced Learning

This is one of the more popular purposes of using binaural beats. Using the right frequency can help your brain become more open to learning new concepts and help it file them in the correct place so you have them when you need them. Binaural beats helps the listener to develop stronger ability in spatial perception and retaining things heard which enhances our ability to learn.

Improving Your Memory

Your long term memory is controlled by your subconscious self. Helping your mind make connections between materials or file it in the correct place can greatly enhance your memory skills. Using binaural beats can help you improve your ability to file old and new information so it's easier to locate on tap.

Lucid Dreaming

If you've ever been in a nightmare that you've wanted to wake yourself up from but can't then learning to lucid dream may be a great tool. It can be an incredibly empowering skill if you want to work through issues, problem solve or take charge of your dreaming state.

In a lucid dream, the person is aware they are dreaming. It's also known as a conscious dream. A lucid dreamer is able to manipulate the people and surroundings in the dream environment. The lucid dream can feel very real and vivid depending on how aware the people are of their lucid state.

Recommended Resources:

[Nitrofocus®](#), [Brain Salon](#), and [Trinity Trance Technology™](#)

This digital book is distributed by [Chris Cade](#)

Who Should use Binaural Beats?

While some people can experience them as part of a normal nights sleep, dreaming, and then realizing they can manipulate the dream to change it, others can move into lucid dreaming for a wakeful state using tools including binaural beats. The existence of lucid dreaming has been well established scientifically. A seasoned lucid dreamer may be able to use this state to work through areas of stress, and visualize situations they need to explore success in.

Increasing Creativity

If you want to develop a more creative outlook, then binaural can help you. With many jobs now including a creative component, or people needing creativity in their everyday life, [increasing your creativity](#) can have far reaching results. Learning to move into a lucid dreaming state, and then exploring your mind at a leisurely and relaxed pace can help you problem solve and create new ideas without your logical conscious state interfering..

Out of Body Experiences

Binaural beats are sometimes used to aid people to reach an out of body experience. There is still a lot of research going into this area (especially at the Monroe Institute) with people trying to discover how to measure these phenomena and prove it does work. This also includes such ideas as astral projection, telepathy, and even telekinesis.

Recommended Resources:

[Nitrofocus®](#), [Brain Salon](#), and [Trinity Trance Technology™](#)

This digital book is distributed by [Chris Cade](#)

Who Should Not use Binaural Beats?

The use of binaural beats works for many people but there are a few conditions on using them to ensure they are used safely and effectively.

Even though you can't hear the beats under the music, they can provoke a powerful response in your brain. SO only use them if you are in a safe place such as sitting in a chair or lying on a bed.

Listening to binaural beats in the car is not considered safe. They can prevent us from completely focusing on the road, and they quieten the conscious mind that we need to drive effectively. The same goes for operating heavy machinery and working on jobs that require concentration.

If you have any history of epilepsy or seizures, you should consult your doctor before starting on a program of listening to binaural beats. Tracks that come with a visual stimulus are best to completely avoid as these have been known to trigger seizures.

Like anything that takes us from a conscious to a relaxed state, it is best to use these who sober. The use of this alongside heavy alcohol or recreational drug use is not advised at all. Both alcohol and drugs alter the brain and also alter your ability to make unimpaired and healthy judgments. We want to entrain our brains to work the best way they can, bringing health and vitality back to our bodies. Using binaural beats in a drugged or inebriated state does not honor our bodies, nor support our brains to learn what is best for our bodies within the contexts of our normal waking state.

If you are pregnant and wish to use binaural beats or have any other pre-existing medical condition, use them carefully and first consult with a physician. Track any changes you notice in yourself, and listen to how it makes your brain and your body feel.

Recommended Resources:

[Nitrofocus®](#), [Brain Salon](#), and [Trinity Trance Technology™](#)

This digital book is distributed by [Chris Cade](#)

Who Should Not use Binaural Beats?

Our brain, our thoughts, our body and our health is all closely interconnected and nothing happens in a vacuum. If you struggle with a physical ailment, this can affect the binaural beats effectiveness, and in turn listening to the binaural beats can affect the ailment. As long as it's a positive change that is well and good, and it is best to monitor accordingly.

Which Are Right for Me?

Our human ears can't hear every sound under the sun. If you remember that dog whistle right at the beginning, the reason we can't hear it is that the pitch is created at a higher frequency than we are able to hear.

Our brain can hear sounds from 20hz to 20 000hz. Some scientists have said we can also hear sounds under 20hz, or rather we may not be able to hear them, but when they are played our brain reacts to them. These may not be immediately audible to our ears, unless played very loudly, but binaural beats below this limit have been produced in the brain during experiments.

We have five main brainwave states in our brain, each corresponding to a different level of consciousness. The precise frequencies vary a little person to person, so a range is provided to compensate.

Delta: Less than 4hz

The state of awareness our deepest one, a state where we don't dream, and lose all sense of body awareness.

Use binaural beats in this range if you want to experience better sleep. Listening to these just before bed can help lead you into a deep and restful state.

Recommended Resources:

[Nitrofocus®](#), [Brain Salon](#), and [Trinity Trance Technology™](#)

This digital book is distributed by [Chris Cade](#)

Which Are Right for Me?

Theta: 4-7hz

This is our REM sleep, the part of our sleep that we dream in. It's also possible to reach this state with deep meditation. Lucid dreaming can be done at this level as we are both unconscious enough to give our subconscious rein, but aware enough to control the actions of us, others in the dreams and our environment.

Because this helps the subconscious play, this state is best for people who want healing of either their bodies or their mind. It allows our brain to fix the broken parts itself.

Alpha: 7-13hz

This is the lightest level of relaxation state, and we move into this state every day as we fall asleep and then as we awake. It's that lovely sleepy, relaxed state that we drift off from into sleep. It's also our meditation and distressing state and can be very energizing if you are experiencing large levels of stress.

Recommended Resources:

[Nitrofocus®](#), [Brain Salon](#), and [Trinity Trance Technology™](#)

This digital book is distributed by [Chris Cade](#)

Which Are Right for Me?

Beta: 14-35hz

If you are active, or busy, and are thinking anxious thoughts, this is the state your brain is currently in. If you want to increase your learning potential, select binaural beats in this frequency to enhance the learning process.

Gamma: More than 40hz

This is our conscious state. Our higher mental activity resides in this state and we engage these brainwaves when problem solving. Our brains are in this state for much of the day, and we generally don't need to increase our amount of time spent in this state.

The brain will entrain within one of these frequencies, selecting the one that is the best match for the sounds played. For example if it is played in the alpha range, it affects the alpha brainwaves, and improves our relaxation.

Sounds played that correspond to the beta brainwaves however would make you feel more alert as they are part of the awake brain. A study that set out to show how different frequencies could change the brain in different ways took two groups of people and played different frequencies to each. One group was played frequencies in the Beta range, and the other was played frequencies in the Delta range. After the tracks were played they found that listeners of the Beta range tested as being more awake and alert than those listening to the Delta beats.

Does Brainwave Entrainment Actually Work?

Many people have used binaural beats over the years and found they are helpful at changing patterns of behavior, helping them to move into a state that helps the brain relax or learn faster.

However, nothing we do works best only in isolation. For instance if you want to use binaural beats to help intensify your learning times, you'll still need to ensure your study space is conducive to learning (clear and not too cluttered, and in a quiet place.) You'll still need to plan out your study time and then stick to your plans. Pinning all your hopes on listening to beats under music every day isn't going to change your grades unless you do the work yourself

Similarly if you are using them to help you reduce your stress or learn to relax, commit to making choices alongside your listening to expedite it. There is no point in investing your time, and energy in listening to the beats, then coming off and spending the next two hours whirling yourself into a stressful slather and eradicating any good you did.

Binaural beats WILL help you, but along the way you need to continue to help yourself. You will need to keep on working at it. You may find that other things will help you develop alongside listening to binaural beats such as making sure you have good day to day routines, or eating foods that energize and bring health to your body and mind. As your brain starts to engage more readily, allow yourself to change any habits that haven't been constructive in your life and develop new empowering habits.

You may find other relaxation methods will enhance the time you spend listening to binaural beats. Self hypnosis can help develop some of the brain work you have begun and take it to another level.

You may find as you change you'll discover new interests or patterns that help to take you to where you were headed.

Does Brainwave Entrainment Actually Work?

This also means you lose some old disempowering behaviors. This sounds great at the outset but our bodies and mind are actually quite resistant to change (even good ones). You may find the first few weeks can include some struggle to let go of old behaviors. Sometimes it can feel a little like we are losing our best friend. Our habits and behaviors are all a part of what makes us who we are and our bodies like us to stay the same even when we are making good changes. If you are aware that your body may put up a bit of a fight as your mind starts to adapt, you'll be more likely to allow your body and brain to make the changes they need to make at their own pace.

This sense of needing to stay the same is what causes many people to “fall off the wagon” when they are trying something new. It's just our body rebelling against the change. It's one of the reasons it is so important to use the binaural beat tracks on a regular basis. It helps our brain to remember what it is meant to be doing and why.

It's a little like training for a marathon. If you plan to run in six months' time, you can't just train for the first month then hope it's going to see you through til the race. You start as you mean to go on and you set up regular training programs so when the big day comes you are ready for the challenge.

The degree of success you will experience with binaural beats comes down to one important factor - You. If you commit yourself to success with it, and allow yourself to incorporate listening to your tracks every day, and then allow your brain as it changes to then tell you what changes you need to make, then you'll find success. Otherwise it's a little like going to a weight loss meeting for two hours and then buying six doughnuts on the way home to eat after dinner.

Am I Opening Myself Up to Weird Thoughts?

We all know the brain is a powerful thing. Most of us are also pretty fond of our brains, and don't really want anything strange to mess with them. It's important to know that your brain is clever enough to only allow you to go as deep as you feel comfortable with. If you are worried about going into a deep trance that you'll never wake from, you can be rest assured that will not happen.

A trance state is one where you feel both relaxed and energized at the same time (also referred to as "Mind Awake, Body Asleep"). You don't lose consciousness, though as mentioned elsewhere in this report, you can become relaxed enough to fall asleep. Unless that does happen (and if you are listened to it to help with sleep that's the desired result anyway) then the most it's going to feel like is a sense of being awake but not caring that you are conscious- just in a happy relaxed spot between awake and dreaming.

It's a completely natural state to be in and one that you can shift into without binaural beats to aid you. In fact, you do this every night as you shift from awake to asleep, and again in the morning when you shift from asleep to wakefulness. You won't be in that state from the moment the first beats are played, but rather will be taken to that place gradually and naturally as the tracks are played.

Because our behavior changes as our brain changes, it is important that you record changes in your life as you begin to listen to binaural beats. As humans we are specialists in reducing our solutions into something we did completely ourselves instead. We listen to the binaural beats, we change, and then we take all the credit for the change, forgetting that we started those changes with the power of binaural beats (or any other technology / system / program we use).

Keep a very simple journal just to record listening to the binaural beat tracks, and any reflections on it.

Recommended Resource #2: Trinity Trance™

“Overcome Anxiety, Fear, and Doubts --Guaranteed”

[Click Here To Learn More](#)

This audio, produced by Chris Cade, helps you overcome anxiety, fears, and doubts.

It does this through a unique combination of industry-leading brainwave entrainment, expertly guided hypnosis and visualization, and trance-inducing background music.

No other brainwave entrainment program on the market utilizes all three of these trance-inducing fear-reducing technologies.

One listener has even noted that it has a “Pavlov’s Dog” effect on her – as soon as she hears the first words, she’s almost instantly drops into a state of peace.

It’s completely 100% safe – and incredibly SIMPLE to use.

About The Author: Chris Cade

In 2006, Chris was faced with seemingly insurmountable relationship challenges.

He looked into spirituality, and shortly thereafter attended a program where he delved deep into his consciousness and consequently became a spiritual student for life. Over the course of several years, he transformed – moment by moment – into the empowering teacher he is today.

At the heart of Chris' teachings is his experience as a software tester. If he can't make something work for him, he won't teach it. His product management skills enable him to create resources that serve people worldwide. In addition to his professional experience, Chris has a wealth of life experience...

He holds two second-degree black belts in Tae Kwon Do, the US National Champion title, and he placed third at the Super Grands World Games in 1994. Chris has taught martial arts to students of all ages, firewalked with Peggy Dylan, swum with wild dolphins, traveled to more than a dozen different countries, and is a grateful father.

All this and more give him a solid foundation to support others on their own journeys of self-discovery. Frequently described as insightful, engaging, authentic, and inspiring, Chris is also a popular interview guest. Today, Chris reaches hundreds of thousands of people worldwide in over 150 different countries. Learn more about Chris and his programs at <http://www.ChrisCade.com>

You Can Earn Money By Sharing This E-Book

The next step in the evolution of the web is for people to get paid for sharing information. Fortunately, that time has finally arrived...

You are probably already sharing information online through social media websites like Facebook, Twitter, and Pinterest. You may even have your own blog, website, or email list where you share great content.

And here's something you are really going to like: You can get paid for doing that!

[Learn How You Can Get Paid To Share This E-Book](#)

This is made possible by [Loyatepays](#), a free referral program where you can build several streams of income for simply sharing videos, eBooks (including this one!), InfoGraphics, Cartoons, etc

And - here's the really exciting part... you don't even have to sell anything.

[Loyatepays](#) is that rare opportunity that actually rewards you for doing something good. There is a whole library of quality publications just waiting for you to give away and you get top quality training too - all completely free.

Does that sound interesting?

You Can Earn Money By Sharing This E-Book

Well it should. And it gets a whole lot better because this program can potentially earn you a residual income. All for doing something so very simple: Sharing stuff you love. ☺

All you have to do is choose a video, ebook (like this one), or picture from the library that you like. Then give it away to the people you know and are connected to.

It really is that easy. Each day, just log into Loyaltepay.com, pick a few things to share, and watch people thank you AND see your income increase.

The best part is, you can even earn money in multiple ways. And as soon as you join, you get full access to their free training and full content library. You can potentially start earning right away.

So what are you waiting for? Get started today for free!
